

R-cam 1300

396 Meter Version

- The 396 meter version of the R-cam 1000 is the same in functionality as the original unit.
- The primary difference is that the system is powered by twin batteries instead of one

- One battery powers the winch motor and electrical functions
- The other battery powers all the camera functions
- Please note the cables for each battery have specialized plugs for plugging into the control unit

The camera-side battery connects to the control unit with the female, 3-pronged connector power cable

The winch battery connects to the control unit with the round, quick-connect power cord

- The winch battery is labeled for your convenience
- The batteries are the same inside, so you can use either one on either side
- But the connector cords are different and can only be used in the proper port
